

As a long time 160-meter operator and experimenter, I enthusiastically support RM-10352 as written.

160 Meters offers a unique environment for experimenting with CW and the new narrow band digital modes. Separation of wide and narrow modes would encourage such experimentation.

The 160-meter allocation is large enough that such a separation would not severely impact any existing operating mode. But, would serve to encourage experimentation with low power and narrow band modes.
